Would you like to have a wireless hotspot for free and with no ads? Read this instructable to find out how. You must connect to a network before beginning the process. This is the website where you will download the program. This will download the program. Save the file. Click on run when it pops up and then click the Next button to start the installation. This should take 20-30 seconds maximum. Decide on a network name (SSID), password, and select "shared connection" to the current wireless connection that you are on. You can do that by clicking on the Internet icon at the bottom of your page or somewhere on your page. Under the network name you are connected to, it will say the connection type (ex: Wireless Network Connection above the network you are connected to in the list of networks). D-Link WiFi Extenders Eero WiFi Systems Ethernet Switches Linksys WiFi Extenders Mesh WiFi Systems Mobile Hotspots NETGEAR WiFi Extenders TP-Link WiFi Extenders WiFi Extenders Wireless Access Points Feature You might be pretty fast with your mouse in Chrome, but these keyboard shortcuts are even faster. Best Picks If you have the need, the need for VPN speed, we've got recommendations about the best choices for you. Best Picks If you're looking for a good VPN to get your game on we've got recommendations for your needs. Updated Few elements of your home's infrastructure have a bigger impact on your tech life. We recommend mesh Wi-Fi routers for most people, and we'll help you find just the right one for your needs. Best Picks When you've just gotta have the latest Slackware build, you want to make sure that your VPN is up to the task. Feature Google's delightful Doodle games make for a fun way to pass a bit of free time. Read on to see 14 of our favorites. Feature Stability AI released Stable Diffusion this week, an AI model that allows you to create AI art right on your own PC. Beware, though, as it demands cutting-edge hardware. Updated Surfing the web through a virtual private network (VPN) can keep your identity and data safe and secure online. We show you what to look for in a VPN and help you pick the best one for your needs. News Get wrekk, spammers. Security researcher Troy Hunt has created a hilariously devious 'password purgatory' for people invading his inbox. Deal Post Featured on Lifehacker and Digital Spy, this service uses DNS to only re-route the connections you want to make rather than all network traffic, so you don't have to worry about your speed being negatively impacted. Best Picks When you need a quick free VPN connection for your Android phone or tablet here are the services we recommend. Feature With three versions of Wi-Fi on the market, picking a router is more complicated than ever. News Google is trying to shove a lot of its services into Gmail's web interface — here's how you kick them off. Best Picks VPNs are best when they're paid for, but if a premium account isn't in the cards then here are our top recommendations for a free service. How-To Midjourney offers a spectacular way to generate AI art, and the open beta allows you to generate 15 awesome images for free. Deal Post NordVPN is considered one of the best web security options on the market today. News Facebook has added a "Feeds" tab, which will organize your Facebook timeline in chronological order. Best Picks Amazon's Fire TV Stick runs many apps including VPNs to watch shows from overseas services quickly and easily. Opinion! can manage unruly collections of tabs a lot easier — and the same trick works in Edge, too. Updated Prime Day is here, and you can save big on all sorts of tech. Android Central is supported by its audience. When you purchase through links on our site, we may earn an affiliate commission. Here's why you can trust us. Do you have a tech question keeping you up at night? We'd love to answer it in a future Tech 911 column! Describe your problem in an email to david.murphy@lifehacker.com, and make sure you put "Tech 911" in the subject line. I can't resist a good wireless mystery, and this week's question-writer for Lifehacker's Tech 911 has a good one — an issue that you don't even think about until it happens, and then it consumes your mind as you try every trick in the book to get your wifi back. I'll let Lifehacker reader Joe explain: "I lost my wifi after the latest update and after reinstalling W10, and doing the updates that were waiting, I lost the wifi again when I turned my laptop off and restarting. So I did it again, no updates, and set it to never turn off. So far so good. But obviously I can't leave it this way. Any suggestions?" Drivers, drivers, and more drivers My first guess, Joe, is that there's some kind of driver issue that's causing chaos with your laptop's wifi card. It's somewhat telling you can get a working wireless connection when you have a barebones installation of Windows 10, but you lose your ability to connect whenever you install any new updates. Obviously, either something in the update (or something downloaded and installed alongside it) is causing your chaos. However, I don't think the long-term answer is never updating your laptop. And never turning it off is an even worse idea for your laptop's longevity and your monthly electric bill. It's always ideal to have a system that's as updated as possible, so any vulnerabilities or other security issues in the operating system are patched. The same is true for any system stability issues, feature updates, or anything else Microsoft has cooking. I wouldn't run an operating system that isn't updated to its latest and greatest version — at least, not if I had the choice between Windows 10 (the old version that shipped with my laptop) and Windows 10 (the latest version). What I would suggest is to hit up your laptop's manufacturer on the web — while you still have an internet connection, that is. Somewhere on the support section of their site, there should be a way to search for your specific laptop model. Once you do, you'll either be presented with a list of drivers you can manually download or possibly even some tool you can install on your system that grabs the most up-to-date drivers (and/or firmware) from the manufacturer directly. Note that what your manufacturer installs might be different than what Windows wants to install via the Windows Update app (if you ever notice it wanting to give you updated wireless drivers, for example). While I'd normally go with whatever Windows wants for the sake of convenience, it's possible that doing so is what's screwing up your connection in this scenario. So, on your manufacturer's support site, you're going to want to download whatever the latest version is of the wireless and/or network drivers it offers. And while you're there, make sure you've installed any available BIOS updates for your laptop (just in case). Update your BIOS, then install the wireless and/or network drivers you downloaded onto your system. You should still be good to go with an internet connection; you can then download and install all of your pending Windows 10 updates and see what happens. If you lose connectivity, try reinstalling the aforementioned wireless and/or network drivers once more. That should, in theory, fix whatever is affecting your system. Other than that, your other option is to pull up Windows 10's Device Manager, find your wireless network adapter, right-click, select Properties, click on the Driver tab, and "Roll Back" the driver. No guarantee this will fix your problem, but it's worth a shot. (You can also try uninstalling the entire device and then reinstalling the aforementioned from-the-manufacturer drivers to see if that helps. Finally, you can try searching for drivers directly from your network card's manufacturer — for me, that's Intel, from the screenshot above. It's possible that a new (or beta) driver will help you out, but I'd try this option last. Generally speaking, drivers offered through Windows directly or drivers from your laptop's manufacturer (likely older) are your best bet. But something's better than nothing if you're still finding that you're not able to make any wireless connections from your laptop. And if none of these solutions work, you might just want to pull the trigger on a cheap USB wireless adapter. It's an inelegant solution, and I hate the idea of spending money on something that should just work, but it'll cost you less than \$20 to get wireless connectivity back on your laptop. I'd do that before I left an unprotected PC on all the time, at least. Do you have a tech question keeping you up at night? Tired of troubleshooting your Windows or Mac? Looking for advice on apps, browser extensions, or utilities to accomplish a particular task? Let us know! Tell us in the comments below or email david.murphy@lifehacker.com. With Windows 10 finally launching this week, we're going to see a slate of articles discussing the OS's new features and capabilities. Some of these are significant upgrades compared with what came before, while others could be potentially controversial. One new option, brought over from Windows Phone 8.1, is called WiFi Sense, but its debut on the desktop could be controversial given what the feature does. WiFi Sense will automatically connect you to detected crowdsourced WiFi networks, acquire network information and provide "additional info" to networks that require it (it's not clear exactly what constitutes additional info), and can be used to automatically share your WiFi password with your contacts on Facebook, Skype, and Outlook. That last feature is the potentially controversial one. WiFi Sense is enabled by default in Build 10240 of Windows 10; if you choose "Express Settings," Microsoft enables the option and allows your device to acquire WiFi passwords from friends and shares your password with the same group of people. If you choose to leave the function enabled (or turn it on manually, as shown below), it will request permission to connect to Outlook, Skype, and Facebook on your behalf. Other users on your friends list who also run Windows 10 will have their contact information shared with you as well, assuming they also enable the feature. Microsoft claims that this feature improves security and reduces frustration. Now, instead of painstakingly spelling or writing down passwords for guests or friends, they can automatically acquire them as soon as they come in-range of your home network. The company's FAQ states: "When you share Wi-Fi network access with Facebook friends, Outlook.com contacts, or Skype contacts, they'll be connected to the password-protected Wi-Fi networks that you choose to share and get Internet access when they're in range of the networks (if they use Wi-Fi Sense). Likewise, you'll be connected to Wi-Fi networks that they share for Internet access too. Remember, you don't get to see Wi-Fi network passwords, and you both get Internet access only. They won't have access to other computers, devices, or files stored on your home network, and you won't have access to these things on their network." In theory, Microsoft could be right, but the company is also creating a de facto database of WiFi information. Elsewhere in the FAQ, Microsoft notes that if you choose to share this information, it's sent via an encrypted link to Microsoft, who stores the data on their own servers (again in encrypted format). This isn't as foolproof as it might have once seemed; we've covered multiple bugs related to Internet encryption standards in the past nine months. The other concern we have with WiFi Sense is that the feature has no granularity beyond the service level. I can choose to share or not-share information with Facebook, Outlook, or Skype, but that's it. If you share your network information with anyone on your Facebook friends list, you're sharing it with everyone on your Facebook friends list. That's something Microsoft really ought to have addressed when it brought the feature over from Windows Phone, just because I want to share this kind of data with some people doesn't mean I want to share it with everyone. The continued degradation of privacy The risk of exposing your network connection to ne'er-do-wells on Facebook or Outlook.com is small, but it's not zero. The bigger issue I want to highlight, though, is how features like this indirectly erode the concept of user privacy and the perceived need for good security practices. This is something we've talked about before in relation to Apple, but it's not just an Apple or a Microsoft problem. On the one hand, we tell people that they need to secure their data with strong passwords while research shows how passwords are trivial to hack — even many strong passwords can be cracked fairly easily. Services like LastPass promise to offer protection, only to fall prey to hacks in turn. When companies get hacked, whether it's Target or LastPass, the consequences of these failures are often trivial. Even Lenovo, which installed one of the most appalling breaches of user-security to ever ship on modern PCs, appears to have come through its Superfish debacle largely unscathed. This tension is at the heart of all security systems, not merely the online ones. If designing secure systems is difficult, designing secure systems that are both fast and easy-to-use is borderline impossible. Nonetheless, online companies often encourage users to share information that proper security practices say ought not be shared, while the consequences of security breaches for the companies that breach them are so small, it sends the message that hey — privacy and security aren't really things you need to care about. And it just so happens that this relatively lax attitude towards privacy underwrites the business model of multi-billion dollar corporations, many of whom seek ever-more lenient rules on what they can and cannot do with your personal information. On a practical level, the risks from WiFi Sense are small. But from a best-practices security standpoint, it's far from a great idea.
